DETAILED ACTION

This office action is in response to the Amendment filed 13 March 2009.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-2 and 5-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevenson et al. (U.S. Patent 5,746,961), in view of Asato et al. (U.S. Patent 5,030,681). Regarding Claims 1-2, and 5, Stevenson et al., hereafter "Stevenson," show that it is known to carry out a method of manufacturing a high surface energy molded article with an injection mold having an inner surface (Abstract), the method comprising: spraying a coating solution to the inner surface of the injection mold (Abstract; Column 3, lines 8-9; Column 4, lines 66-67); introducing a thermoplastic resin having a temperature on the coating in the injection mold, the thermoplastic resin having a predetermined heat energy, to transfer at least a portion of the heat energy of the thermoplastic resin to the coating (Column 2, lines 59-62; it is interpreted that the resin will implicitly be introduced at an appropriate molding temperature, such as that which is claimed); defining a molded article having a surface (Column 3, lines 10); and maintaining contact of the thermoplastic resin and the coating for a predetermined time period to diffuse the coating through at least a portion of the surface of the molded article (Abstract; Column 7, lines 4-10). Stevenson does not show using a chlorinated polyolefin coating. Asato et al., hereafter "Asato," show that it is known that a coating of chlorinated polyolefin increases surface energy for enhanced adhesion (Abstract; Column 2, lines 18-26). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Asato's particular coating during

Art Unit: 1791

Stevenson's molding process in order to impart the desired adhesion and stability to the final molded article (See Asato, Abstract; Column 2, lines 7-17).

Regarding Claims 6-7, Stevenson shows the process as claimed as discussed in the rejection of Claim 1 above, including a method wherein an electrically conductive substance of nickel is also applied to the inner surface of the mold (Column 4, line 53), meeting applicant's claim.

Claims 3-4, 8-13, and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevenson and Asato, further in view of Pettit, Jr. et al. (U.S. Patent 4,937,288).

Regarding Claims 3-4, Stevenson shows the process as claimed as discussed in the rejection of Claim 1 above, but he does not show electrically charging the particles. Pettit, Jr., et al., hereafter "Pettit, Jr." show that it is known to carry out a method of coating, including applying an electrical charge to the plurality of powder particles of the coating and electrically grounding the article to be coated (Column 15, lines 34-36). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Pettit, Jr.'s electrical charging steps during Stevenson's spraying process because electrostatic spraying is known as a feasible method for applying a coating to a substrate.

Regarding Claims 8-11, Stevenson et al., hereafter "Stevenson," show that it is known to carry out a method of manufacturing a high surface energy molded article with an injection mold having an inner surface (Abstract), the method comprising: spraying a coating solution to the inner surface of the injection mold (Abstract; Column 3, lines 8-9; Column 4, lines 66-67); introducing a thermoplastic resin having a temperature on the coating in the injection mold, the thermoplastic resin having a predetermined heat energy, to transfer at least a portion of the heat energy of the thermoplastic resin to the coating (Column 2, lines 59-62; it is interpreted that the resin will implicitly be introduced at an appropriate molding temperature, such as that which is claimed); defining a molded article having a surface (Column 3, lines 10); and maintaining contact of the thermoplastic resin and the coating for a predetermined time period to diffuse the

coating through at least a portion of the surface of the molded article (Abstract; Column 7, lines 4-10). Stevenson does not show using a chlorinated polyolefin coating. Asato et al., hereafter "Asato," show that it is known that a coating of chlorinated polyolefin increases surface energy for enhanced adhesion (Abstract; Column 2, lines 18-26). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Asato's particular coating during Stevenson's molding process in order to impart the desired adhesion and stability to the final molded article (See Asato, Abstract; Column 2, lines 7-17). Stevenson does not show electrically charging the particles. Pettit, Jr., et al. show that it is known to carry out a method of coating, including applying an electrical charge to the plurality of powder particles of the coating and electrically grounding the article to be coated (Column 15, lines 34-36). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Pettit, Jr.'s electrical charging steps during Stevenson's spraying process because electrostatic spraying is known as a feasible method for applying a coating to a substrate.

Regarding Claims 12-13, Stevenson shows the process as claimed as discussed in the rejection of Claim 8 above, including a method wherein an electrically conductive substance of nickel is also applied to the inner surface of the mold (Column 4, line 53), meeting applicant's claim.

Regarding Claim 15, Stevenson shows the process as claimed as discussed in the rejection of Claim 8 above, but he does not show the particular surface energy of the claimed invention. However, since Stevenson, Asato, and Pettit, Jr. teach the claimed process, then the resulting product would have a surface energy of at least 38 dynes per centimeter after the step of removing the molded article from the mold. Further, because Asato teaches improved adhesion of chlorinated polyolefin coatings, it is submitted that Stevenson and Asato suggest the improved surface energy of at least 38 dynes/cm.

Claims 16-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevenson and Pettit, Jr.. Regarding Claims 16-17, Stevenson shows that it is known to carry out a method of manufacturing a high surface energy molded article with an injection mold having an inner surface (Abstract), the method comprising: spraying a coating solution to the inner surface of the injection mold (Abstract; Column 3, lines 8-9; Column 4, lines 66-67); introducing a thermoplastic resin having a temperature on the coating in the injection mold, the thermoplastic resin having a predetermined heat energy, to transfer at least a portion of the heat energy of the thermoplastic resin to the coating (Column 2, lines 59-62; it is interpreted that the resin will implicitly be introduced at an appropriate molding temperature, such as that which is claimed); defining a molded article having a surface (Column 3, lines 10); and maintaining contact of the thermoplastic resin and the coating for a predetermined time period to diffuse the coating through at least a portion of the surface of the molded article (Abstract; Column 7, lines 4-10). Stevenson does not show electrically charging the particles. Pettit, Jr., shows that it is known to carry out a method of coating, including applying an electrical charge to the plurality of powder particles of the coating and electrically grounding the article to be coated (Column 15, lines 34-36). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Pettit, Jr.'s electrical charging steps during Stevenson's spraying process because electrostatic spraying is known as a feasible method for applying a coating to a substrate.

Page 5

Claims 18-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevenson and Pettit, Jr., further in view of Asato. Regarding Claims 18-19, Stevenson shows the process as claimed as discussed in the rejection of Claim 17 above, including a method wherein an electrically conductive substance of nickel is also applied to the inner surface of the mold (Column 4, line 53), but he does not show using a chlorinated polyolefin coating. Asato shows that it is known that a coating of chlorinated polyolefin increases surface energy for enhanced adhesion (Abstract; Column 2, lines 18-26). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to use Asato's particular coating during Stevenson's

Art Unit: 1791

molding process in order to impart the desired adhesion and stability to the final molded article (See Asato, Abstract; Column 2, lines 7-17).

Response to Arguments

Applicant's arguments filed 13 March 2009 have been fully considered but they are not persuasive.

Applicant contends that Stevenson does not show any coatings, specifically chlorinated resins, that are capable of increasing surface energy. This is not persuasive because Stevenson was not cited to show these features.

Applicant contends that Stevenson teaches away from the coating because he prefers solvent resistance, hardness, and surface toughness. This is not persuasive because there is no evidence in the record that these properties are mutually exclusive with increased surface energy.

Applicant contends that Asato fails to cure the alleged deficiencies of Stevenson because Asato and Stevenson are not properly combinable with each other. In response to applicant's argument that Asato and Stevenson are nonanalogous art, it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as a basis for rejection of the claimed invention. See *In re Oetiker*, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992). In this case, both references are in the field of applicant's endeavor (applying coatings to injection molded articles).

Regarding Claims 3-4, 8-13, and 15-19, applicant contends that Pettit, Jr. does not cure the alleged deficiencies of Stevenson as previously argued. These alleged deficiencies are not persuasive as noted above.

Further, applicant contends that Pettit, Jr. and Stevenson are not properly combinable with each other. In response to applicant's argument that Pettit, Jr. and Stevenson are nonanalogous art, it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as

Application/Control Number: 10/840,022 Page 7

Art Unit: 1791

a basis for rejection of the claimed invention. See *In re Oetiker*, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992). In this case, both references are in the field of applicant's endeavor (applying coatings to substrates).

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MONICA A. HUSON whose telephone number is (571)272-1198. The examiner can normally be reached on Monday-Friday 7:00am-4:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Christina Johnson can be reached on 571-272-1176. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
